

Activity 12: Portfolio Brief & Prompt Log

Riya | 3rd Semester B.Tech CSE, REVA University | Portfolio Building (B25CS0311)

Part 1 — Portfolio Brief

Who I am

I'm Riya, a 3rd semester B.Tech Computer Science and Engineering student at REVA University. I'm early in my CS journey but already have a few real, working things on GitHub rather than just coursework — a few algorithmic practice repos and a machine learning mini-project from a virtual internship. This portfolio page is meant to put that in one place so it's actually visible, not just sitting in separate repos.

What I built in Activities 1, 4, and beyond

- Hello World repo (Activity 1) — my first GitHub repo, where I set up VS Code, Git, and GitHub end to end.
- LeetCode solutions repo — 8 problems solved in C++ across arrays & strings, basic algorithms, and stacks (Two Sum, Reverse String, Valid Anagram, Best Time to Buy and Sell Stock, Longest Common Prefix, Binary Search, Move Zeroes, Valid Parentheses), plus a bonus Reverse Linked List problem. Each solution has local tests (typical + edge cases), a written approach/complexity doc, and an Accepted screenshot.
- HackerRank solutions repo — 5 problems solved in C (Diagonal Difference, Dynamic Array, Time Conversion, Compare the Triplets, Sparse Arrays), same pattern of tested solutions with documentation.

Other things worth mentioning

- DecodeLabs virtual internship (Batch 2026): built a rule-based chatbot ("bauerr") in Python, and an Iris flower classifier using K-Nearest Neighbors with scikit-learn, including confusion matrix and K-tuning visualizations.
- Datathon project: contributed an AI-powered chatbot widget ("SafetyBot", using the Claude API) to a Community Safety dashboard for Bengaluru.
- Currently working on a Smart India Hackathon (SIH) 2026 team project.

Skills

C, C++, Python, and early Java; data structures & algorithms practice; Git/GitHub workflows; VS Code tooling; basic machine learning with scikit-learn; HTML/CSS fundamentals.

A goal

I'm genuinely interested in going deeper into AI/ML — the DecodeLabs internship (the chatbot and the Iris classifier) was my first real taste of it, and I want to build on that rather than treat it as a one-off project.

Part 2 — The Generation Prompt

This is the brief above, rewritten as one structured prompt — this is what actually gets submitted to the AI assistant, not the brief itself.

Build a one-page personal portfolio site for me as a single self-contained HTML file. Here's who I am and what to include: Name: Riya. 3rd semester B.Tech Computer Science and Engineering student at REVA University.

Sections needed: About, Projects, Skills, Contact. About: a short bio (3-4 sentences) – early-stage CS student who already has real working repos on GitHub rather than just coursework, currently interning virtually at DecodeLabs, and is genuinely interested in going deeper into AI/ML, with the DecodeLabs internship as a first step in that direction. Projects (list these, each with one link and one line, pulled from my actual repos – do not invent project names or descriptions): - hello-world – Hello World in C, C++, Java, and Python; my first GitHub repository. Link: <https://github.com/Riya-shelke/hello-world> - leetcode-solutions – 8 LeetCode problems in C++ (arrays/strings, basic algorithms, stacks) plus a bonus linked-list problem, each with local tests and docs. Link: <https://github.com/Riya-shelke/leetcode-solutions> - HackerRank-3rdSem-Portfolio – 5 HackerRank problems in C with tests and docs. Link: <https://github.com/Riya-shelke/HackerRank-3rdSem-Portfolio> Skills: C, C++, Python, early Java, DSA practice, Git/GitHub, VS Code, scikit-learn basics, HTML/CSS. Contact: a simple section with my GitHub profile link and an email placeholder. Tone: professional but approachable, not corporate or stiff. Style: give it a developer/build-log feel rather than a generic resume template – I track my coding practice like a changelog, so lean into that rather than a plain card-based layout. Keep the About section to no more than 4 sentences. Don't invent any projects, stats, or links beyond what I've given you above.

Part 3 — Prompt Log

Prompt 1 (initial generation) — the structured prompt above, submitted in full.

Result: Produced a single-page site with About / Projects / Skills / Contact sections and a dark build-log-style theme, with all three confirmed project links (hello-world, leetcode-solutions, HackerRank-3rdSem-Portfolio) filled in correctly. Review step: checked each link actually matched a real repo, and confirmed no project was invented beyond what was listed in the prompt.

Prompt 2 (refinement): "The About section is a bit long — shorten it to exactly 3 sentences, and make sure it doesn't claim I'm an expert, since I'm only in 3rd semester."

What changed: About section trimmed from 4 sentences to 3, and softened language like "skilled" down to "learning" / "practicing" so it reads accurately for a 3rd-semester student rather than overselling.

Prompt 3 (refinement): "Add real stats next to each project link (problem count, language used, tested-before-submission), instead of generic one-line blurbs — I want it to look like an actual build log, not a resume."

What changed: Project entries now show a one-line stat per repo instead of a generic blurb, which matches the actual repo content and reinforces the build-log framing from the brief.

Part 4 — Reflection

The second refinement (adding real repo stats instead of generic descriptions) made the biggest difference — it's what took the page from "looks like a template" to "looks like my actual work." The thing the AI got wrong on the first pass was a smaller gap I caught in review: it was ready to describe a pair-programming project I hadn't actually built a repo for yet, and only the project links I'd explicitly confirmed made it into the final page rather than anything invented. That's a reminder that

a brief needs to only include what's actually real, since the AI will faithfully build whatever it's given, placeholder or not.
